

Mobile Mammography Screening Wellness Service

Annual Mammograms Can Detect Cancer Early.

Annual mammograms can detect cancer early. Mammograms can show changes in the breast up to two years before a patient or physician can feel them. With early detection, mammograms can also prevent the need for extensive treatment for advanced cancers and improve chances of breast conservation.

Women should receive annual mammograms starting at age 40 - even if they have no symptoms or family history of breast cancer.
